Sacramento, CA 95691 New Hours By Appointment Service scheduling is open remotely. 916 3739699. See our step by step instructions below Starting up your new Caldera Utopia or Paradise Series hot tub is not as overwhelming as it might seem. We realize you may see conflicting information, especially if you are getting tips and advice from the Internet.

It's important to remember that not all hot tubs are made to function in the same manner, so please call your salesperson if you have any questions about starting up your hot tub for the first time. If you have well water private or community we strongly recommend using a prefilter attachment on your water hose to reduce and eliminate problematic minerals from entering your hot tub. Please take the time to read thru the following instructions before starting to fill your new spa and refer to the section below, Hot Tub Water Care Guide, for how to properly balance your new spa's water. Remember the following as you go through this process Do not fill the spa with hot water, as tripping of the high limit thermostat may result. Do not use your spa after filling until all of the steps listed below are completed. Before filling your spa for the first time, remove the equipment compartment door and check to ensure that the unions on either side of the pumps and heater are hand tight. Steps for filling your spa CLOSE ALL DRAINS, remove the filter compartment cover, skimmer basket, weir, and filter. Unscrew the Spa Frog cartridge caps and remove cartridge before filling. The water level of your spa should be maintained at approximately one inch above the highest jet in the spa. Reinstall the filter and then the skimmer basket, and weir once the spa is filled. Your water level should be above the skimmer basket of the filter compartment. IMPORTANT Watkins Manufacturing Corporation does not recommend that the spa be filled with "softened" water, as this may damage the spa's equipment. After the spa has been filled with water and the equipment compartment door is secured, power must be applied to the spa. FIRST activate power to the subpanel from the main house panel. NEXT open the door of the electrical subpanel and reset the GFCI breaker. FINALLY, close and secure the subpanel door.

CHECK THE OPERATION OF THE JET SYSTEM and to purge any remaining air from the heating system, push the "JETS" button on the control panel three times once for Kauai model to run the jet pumps on high speed for one minute. Once the jet system is fully operational as indicated by strong, nonsurging jets, priming of the spa is complete. Turn off the jets by pressing the "JETS" button until all jets have turned off. If you do not feel a steady stream of water from your jets, refer to the instructions for priming the pump in the SPA TROUBLESHOOTING section in your Owner's Manual. IMPORTANT Be sure that the diverter is in position 1 or position 2 see illustration on diverter valves in Owner's Manual before priming the pump for the first time. Make sure you secure the cover in place using the cover locks. Periodically check the spa water temperature. Please refer to our Hot Tub Water Care Guide for more detailed instructions on balancing your hot tub's water. You may raise the water temperature to your desired degree. Hot Tub Water Care Guide for Caldera Spa Customers Balancing your hot tub water should not begin until your spa is heated to the desired temperature. As your water heats up, pH and Alkaline levels may change, so it's important not to rush through the startup process. Once your hot tub has achieved the desired temperature, you may test the spa water for the first time with your test strips. Simply dip the test strip in the water and then pull the strip out of the water and line up the colored pads on the strip to the back of the bottle. Make a note of what your readings are before adding any chemicals to the water. Ideally, your spa's pH should read between 7.2-7.6 ppm and the Alkaline should be between 80-120 ppm. The following instructions are for any customers using an OZONE system. If you have a FRESHWATER SALT system, please scroll to the bottom of this page for a video tutorial on starting up your new FreshWater Salt SYstem.

<http://www.dimalcco.com/images/breville-ikon-instruction-manual.pdf>

Metal Gon If you are on a well private or community we recommend using a full bottle of Metal Gon to keep any problematic minerals in a liquid state, thus preventing unwanted buildup in your hot tub's plumbing lines and mechanical equipment. Turn on you spa's jet pumps and pour the full bottle of Metal Gon in your spa's filter compartment. Allow the jets to run for 3045 minutes and then turn the jets off. You need to allow the Metal Gon to circulate through the spa's plumbing lines over the next 812 hours. We do not recommend adding anything else to your spa water until 812 hours has passed. It's important not to rush this step. **Stain and Scale** If you are on city water, instead of using Metal Gon, we recommend using one third of the bottle 34 oz of Stain and Scale. Run your spa's jet pumps for 30 minutes and then allow the spa to circulate for the next 812 hours. Proceed to next step. If your Alkalinity is high, you may use a tablespoon of Muriatic Acid to reduce the Alkaline reading or you may use pH decriaser, which is also a dry acid and will reduce the overall Alkalinity. Make a note of whatever modifications you make so you will have a good idea of what to expect the next time you fill your hot tub and proceed to the next step. This will establish a base of sanitizer in your new Caldera Spa and rid the water of any organics introduced thru your water hose. Install your Mineral Cartridge inside of your spas filter and secure the filter cap and lid. This will help keep your water fresh and clear by removing organics. **Weekly** You may want to add 12 tablespoons weekly of a granular dichlor while running a "clean cycle" during periods of frequent and excessive use. Test your water for pH and Alkaline levels and adjust if needed. **Monthly** Clean your filter, even if it looks clean, at least once a month. This will remove all organic and mineral build up and will help keep your water fresh and clean.

Just rinse it with a hose on a high power nozzle to release all undesirables. Quarterly Replace your Mineral Cartridge. These have a finite lifespan of four months and should be refreshed 3 times a year. Clean your spa cover to remove any mildew and apply a protective coat of CoverShield to the top of the cover. Drain and refill your spa as needed. This is normal and do not be alarmed. Ozone system effectively burn out the remaining free chlorine, so you will be left with clean, fresh water and none of the heavy chlorine smells that you normally see in spas with no ozone system. FOR FRESHWATER SALT System Customers Here's a helpful video to watch before you start up your new hot tub. Refer to your Freshwater Start Up Guide for easy, stepbystep instructions for starting up your new salt water hot tub. Sign up for our Newsletter today. Please upgrade your browser to improve your experience. Spray! Spritz! Ah, water. Humans are composed of approximately 60% water and we need it to stay alive. Creating and maintaining healthy water balance and chemistry is attainable once you know the essentials. Educating yourself is the key to develop a cache of tools that alleviate any water related challenges. You will build confidence in your routine as you achieve and maintain proper water chemistry. Keeping your hot tub ready to serve you and your family is the goal. Sparkling, clean, clear water will propel you past the goal line. Let's plunge into the knowledge. Water chemistry kits are available online or from spa and pool supply retailers. They include a plastic device used to gather a water sample, and small bottles of chemicals designed to test your water. There are easy to follow directions. Start by filling one or two plastic tubes with spa water. A few drops of chemical added to the water activate a response that changes the color of the water. The plastic tubes have a range of numbers and colors on them to match the color of the water sample.

Use this information and refer to the directions to determine a course of action. You may need to add a treatment chemical or you may not. Remember, it is important to replace your chemicals if they reach an expiration date. The strips are designed to activate once you dip them in your hot tub water. Most will give you an indication of chlorine, water harness, alkalinity, and even calcium. Directions are easy to follow. Use the results to determine a course of action to achieve optimal water quality. Do this as often as needed. They are happy to serve. Their equipment is sensitive and provides a thorough evaluation of the water. A written form of test results will usually be provided. They can direct you to the water care items you need to correct any water imbalances you may have. Be mindful that all recommendations may not be required. The more educated you are about your water chemistry the more likely you are to purchase only the essential items you need. Sometimes it is just the most practical option. Your service provider should be reliable, fair about their fees, and arrive for their visits on a consistent basis. The last thing you want to do is spend more time managing a service provider than you would managing your own hot tub water chemistry. A great service provider can be a welcome member of the team that takes care of your home. Do your

research and you'll be happy with your decision. Well, there's a reason why all the measuring devices include a range of acceptability. There are many things that affect the quality of your hot tub water including but not limited to heat, sun, chemicals and how many people use the hot tub aka bather load. Rest assured variations are guaranteed and adjustments are always within reach. Use your favorite method to determine the healthy ranges for your water, and then relax. Your confidence will build as you develop a routine that works for you.

The following are a few essential items that will make your life easier and your hot tub water clean, clear and sparkling; They fit inside your filtration system and automatically maintain consistent levels of sanitization. They fit inside your filtration system and automatically maintain consistent levels of sanitization. Any measure above 7.0 is considered alkaline. The optimal pH for hot tub water is 7.4, which happens to be the same pH level as the human eye. Defoamer. A defoamer eliminates foaming caused by soap, shampoo, cleaners and other residues. While it is recommended that you shower before going in a hot tub, it isn't always practiced. It can also be used to manage foam caused by soft water. Conditioners and stabilizers. Water harshness can be lessened by using water conditioners. For example, use Vanishing Act which removes calcium buildup for softerfeeling water that is silkier on your skin. It helps protect your spa from the damaging effects of hard water. Stabilizers help keep water chemicals balanced. An option for virtually chlorinefree water care combines the CD Ozone System and Monarch Silver Cartridges. Enzyme based sanitizers are also a chlorinefree option. Stain and Scale Defense. You want crystal clear water and you want your hot tub's surface to look its best too. Stain and Scale Defense prevents calcium build up on spa surfaces and controls stain and scale formation. Calcium Hardness Increaser. Extremely soft water can corrode the shiny and soft surfaces of your hot tub. Calcium Hardness Increaser raises calcium levels in spa water to protect against this type of soft water related damage. Think of the grates in your filter as the gills on a fish. They need to be clean to keep the fish alive. Remove and rinse the filter using a hose with a nozzle to get it clean. Soak the filter in a bucket with an appropriate filter cleaning solution prior to rinsing it if there are excessive impurities.

BANGLENHOSPITAL.COM/UserFiles/File/boss-fs-6-manual.pdf

Any rips or tears in the filter fibers is an indication that replacement is required. Replacing your filter is an easy fix that will bring back your hot tub's ability to play its part in creating sparkling, clean, clear water. Use the measures of water quality to determine when and if your hot tub needs to be drained. If you experience extreme difficulty in maintaining proper ranges it may be time to drain, refill and reset. Other circumstances like the drought conditions in your state or community may limit your ability to drain and refill. But with today's advanced hot tub technologies, excellent water treatment options, and a bit of dedicated attention your water will stay in optimal condition. Any time you drain your hot tub use this time to clean and protect the surface of your hot tub's interior and exterior surfaces according to manufacturer's recommendations. Your hot tub lid deserves some care and attention too. This helpful hot tub maintenance guide will help ensure your hot tub is your sanctuary for improved health and wellbeing. The more you love your hot tub, the more you'll use it! Spray! Spritz! Ah, water. Humans are composed of approximately 60% water and we need it to stay alive. The more you love your hot tub, the more you'll use it.
